In Photoshop (Windows or Mac), point to File > Save As > Save As Type > PNG > Save. Or export > > > file as > PNG > Export. In preview on Mac, select > export > export > > PNG > save. This article describes how to convert JPG to PNG using Microsoft Paint, Photoshop, and Preview (macOS). It also deals with alternatives, including GIMP and online conversion tools. If you're using a Windows-based computer, you already have a built-in tool to convert JPG files to a PNG file. Paint is preinstalled on Windows-based computers and can be used to quickly convert a file from JPG to PNG. Open the file you want to convert from JPG to PNG in MS Paint, and then select File. On the menu that appears, hover over Save As, and then select PNG from the flyout menu that appears. In the Save As dialog box, select the location where you want to save the file, type a name for the file, and then click Save. Then you will see MS Paint convert the file. If you don't use MS Paint on a Windows PC, or if you're on a Mac and you have Photoshop it will do that trick for converting JPG to PNG, too. There are several ways to convert JPG files to PNG in Photoshop. The Save As menu is the easiest way to save a file in Photoshop in a format different from the original. Open the file in Photoshop and select File. Select Save As from the flyout menu that appears. In the Save As dialog box that appears, choose the location you want to save the file to save, name it, and then click the Save As Type drop-down menu. From the list of available file types that appear, find and select PNG (*. PNG, *. PNG). Don't worry if you choose PNG window above the file name. This window displays only files with the same extension as you select. Click Save, and the file is saved to a new format. You can also convert JPG files to a PNG file during export in Photoshop. To do this, choose File > Export > Export As, and in the dialog box that appears, select PNG from the Format drop-down menu. After you make a selection, click Export. Like Windows, mac has a built-in image conversion tool as part of its Preview program. This means that converting JPG to PNG is as easy as a few clicks. Open the image in preview, and then select File. Preview is the default program for viewing pictures on your Mac, but if you've changed your default browser, you can open the file at any time in preview by right-clicking the file, and then selecting Open with > Preview. On the menu that appears, select Export. In the Export As dialog box, add the name of the picture, choose where you want to save it, and then click the Format menu, and then select PNG. When the selection is complete, click Save and the file will be saved as PNG. There are plenty of other free image editing apps that will also convert JPG to PNG files if you need them. For example, you can use GIMP to convert an image in much the same way that you would use the Export as in Photoshop option. You choose Export As, make sure that the correct file type (PNG, in this case) is selected, and then click Save. The same applies to many other programs. In most cases, you'll either have the Export As or Save As option, which allows you to change the file type of the image you're saving. If you are not interested in using software installed on your computer or downloading an image editing file, there are many online services that allow you to convert a JPG file to a PNG file. For example, JPG to PNG is a website that allows you to upload JPG files, convert them and then you can download a new file. One note alert if you plan to use an online converter. Be careful about the site that you choose to convert the JPG file to a PNG file. Some disgusting sites will use conversion as a means of injecting malware into a file that you download in order to infect your computer so they can gain control of it, or use it to displace malware to others. Use online conversion tools only from sources you trust. PNG files are lossless so they don't lose quality over time. They can also have a transparent background. JPG files are loss-making, which means that every time an image is saved, you lose a bit of quality. So sometimes the PNG format is better, depending on how you use the image. Picture.
